

Role: UI/UX Designer & 3D Visualization Specialist
Focus: 3D Product Modeling, Cross-Functional Collaboration, Client Management

Qzeen (Goudish as of 2022) required a digital storefront that reflected the premium nature of its artisanal spices. The project faced a significant logistical hurdle: the web launch was scheduled before final physical product samples were available. The goal was to build a high-fidelity e-commerce experience that maintained brand consistency across digital and physical touchpoints.

Being part of a team with two other Designers and working closely with the Marketing team, I acted as a Hybrid Designer, integrating 3D assets into the UI process. allowing us to build the site in parallel with product manufacturing:

- Using Blender, I developed hyper-realistic 3D renders of the product jars. These renders replaced the need for a physical product photoshoot, ensuring 100% visual consistency across the web catalog and reducing pre-launch production costs.
- Collaborated within a specialized team (Design Lead, Graphic Designer, and Marketing) to ensure the UI perfectly complemented the custom labels and brand identity.
- Took a lead role in presenting design iterations directly to the client. I facilitated the exchange of ideas, translating client feedback into actionable UI improvements and ensuring the final product aligned with their business vision, as well as reducing the total design-revision cycle by half compared to other similar projects of my company.
