

TiVo

Designing for a Multi-Platform TV Experience

TiVo, originally known for its set-top box experience that revolutionized how people watch TV in the 90s, has become in the present years a cross-platform product.

As part of a 15-person design team, as well as working closely with product management and development teams, I contributed to several key projects - while my role initially focused on the mobile app experience, I later had the opportunity to design for nearly all major platforms within the TiVo ecosystem.

(Due to contractual regulations, I cannot showcase wireframes or any in-progress work. All designs presented are part of commercially available products or official presentations used by TiVo-Xperi in product launches and industry events.)

TiVo OS (Smart TV OS)

Designed the Settings experience & USB Media Player

Worked independently on Design & UX while collaborating directly with legal, product, and engineering teams.

One of my main contributions was designing for TiVo's Smart TV operating system, one of Xperi's major projects of 2024, in collaboration with Turkish TV set manufacturer Vestel.

Given the product's presence in both North American and European markets, I collaborated closely with product managers, legal teams, and engineers to ensure that the Settings screens were both highly customizable and fully compliant with regional regulations. This required balancing usability with complex legal constraints while maintaining a seamless experience for users. The design process involved extensive research, multiple iterations, and ongoing collaboration with adjacent teams to refine the final product.

Another major contribution to TiVo OS was leading design efforts for the USB Media Player, where I worked on a full-featured video, audio, and image player, along with an explore section for content discovery. This project involved deep UX considerations, particularly in crafting a responsive, intuitive interface that worked across different screen sizes and input methods. Both projects were handled independently, collaborating directly with the necessary teams.

My contributions spanned four major updates that introduced new features like casting, in-app live player, picture-in-picture mode, and streaming service integrations. Beyond new functionality, I collaborated on a complete design system overhaul, modernizing the app's look and feel while ensuring it remained intuitive and scalable.

Mobile App (Android & iOS)

Contributed to four major updates and visual haul

Worked alongside a senior designer, handling feature design and UI updates while ensuring consistency across mobile platforms.

BMW In-Car Entertainment

Contributed to app screens & third-party partner assets

Worked within a team of four designers, reporting to a design director while collaborating with development teams.

For TiVo's BMW in-car entertainment platform, I helped design UI elements for partner applications, ensuring they fit seamlessly within the infotainment system. Additionally, I collaborated with the design team to create UX screens for the platform, aligning with automotive UX standards and optimizing for a driver-friendly experience.

Other Contributions

IFA 2023 Presentation & Hackathon Support

Designed presentation visuals for an award-winning voice search feature & collaborated on a developer hackathon project.

Worked on presentation visuals for the Tip-of-My-Tongue voice search feature for IFA 2023, later awarded at the event. Additionally, I collaborated with a local development team during a hackathon, designing the dashboard UI/UX for their project.
